Multivariate association analyses To facilitate multivariate association analyses using the methods from [14], we implemented them in an R package *bmass* (Bayesian multivariate analysis of summary statistics). The software requires as input univariate GWAS summary statistics, for the same set of SNPs, on d related phenotypes.

In a multivariate, nonstationary risk analysis framework under a nonstationary environment, uncertainty assessment of the dynamic copula using time as a covariate is of fundamental importance. In this study, a Bayesian Markov Chain Monte Carlo (MCMC) approach is integrated to the nonstationary marginal and copula models to characterize the uncertainty.

An Introduction to Applied Multivariate Analysis with R explores the correct application of these methods so as to extract as much information as possible from the data at hand, particularly as some type of graphical representation, via the R software. Throughout the book, the authors give many examples of R code used to apply the multivariate techniques to multivariate data.
