The Babylonian square-root algorithm The iterative method is called the Babylonian method for finding square roots, or sometimes Hero's method. It was known to the ancient Babylonians (1500 BC) and Greeks (100 AD) long before Newton invented his general procedure. Here's how it works.

Babylonian method to find the square root. Misc Algorithms Data Structure Algorithms. The Babylonian method to find square root is based on one of the numerical method, which is based on the Newton- Raphson method for solving non-linear equations. The idea is simple, starting from an arbitrary value of x, and y as 1, we can simply get next approximation of root by finding the average of x and y.

Babylonian method to find the square root

1 Description. To compute the square root of a number which lies between 0 and 2, one may use a method of successive approximations which involves only the operations of squaring and averaging. The basis of method is the binomial identity: (x+y)2 =x2+2xy+y2. (x + y) 2 = x 2 + 2 x y + y 2. Write the number whose square root is to be computed as 1−x.

Babylonian Method Of Computing The Square Root

Perhaps the first algorithm used for approximating √S is known as the Babylonian method, named after the Babylonians, or "Hero's method", named after the first-century Greek mathematician Hero of Alexandria who gave the first explicit description of the method. It can be derived from (but predates by 16 centuries) Newton's method.
