In analysis, we usually prove inequalities, and we prove those inequalities by estimating. To illustrate the point, consider the following statement. Let  $x$  be a real number. If  $x < \epsilon$  is true for all real numbers  $\epsilon > 0$ , then  $x = 0$ . This statement is the general idea of what we do in analysis. Suppose next we really wish to prove the equality  $x = 0$ .

Concise Introduction to Basic Real Analysis - 1st Edition ...

In mathematics, real analysis is the branch of mathematical analysis that studies the behavior of real numbers, sequences and series of real numbers, and real functions. Some particular properties of real-valued sequences and functions that real analysis studies include convergence, limits, continuity, smoothness, differentiability and integrability. Real analysis is distinguished from complex analysis, which deals with the study of complex numbers and their functions.
