$\int_{D \setminus K} f(z) d^2z = \lim_{\epsilon \rightarrow 0} \int_{D \setminus K_\epsilon} f(z) d^2z$ is a deep result of Calderon-Zygmund [7]. With respect to boundary value problems a modification of the Cauchy-Pompeiu formula is important in the case of the unit disc $D = \{z: |z| < 1\}$.

Boundary value problems in complex

Access Free Boundary Value Problems In Complex Analysis I

Applying the boundary conditions gives, $0 = y(0) = c_1 \cdot 0 = y(\pi) = c_2 \sin(\pi) = c_2 \cdot 0 = 0$. In this case we found both constants to be zero and so the solution is, $y(x) = 0$. In the previous example the solution was $y(x) =$
