This volume situates the work of American poet Charles Olson (1910-1970) at the centre of the early post-war American avant-garde. It shows Olson to have been one of the major advocates and theorists of American modernism in the late 1940s and early 1950s; a poet who responded fully and variously to the political, ethical, and aesthetic urgencies driving innovation across contemporary American art. Reading

Olson's work alongside that of contemporaries associated with the New York Schools of painting and music (as well as the exiled Frankfurt School), the book draws on Olson's published and unpublished writings to establish an original account of early post-war American modernism. The development of Olson's work is seen to illustrate two primary drivers of formal innovation in the period: the evolution of a new model of political action pivoting around the radical individual and, relatedly, a powerful new critique of instrumental reason and the Enlightenment tradition. Drawing on extensive archival research and featuring readings of a wide range of artists including, prominently, Barnett Newman, Mark Rothko, David Smith, Wolfgang Paalen,

and John Cage, Charles Olson and American Modernism offers a new reading of a major American poet and an original account of the emergence of post-war American modernism.

The fundamental mathematical tools needed to understand machine learning include linear algebra, analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or professionals, to efficiently learn the mathematics. This self-contained textbook bridges the gap between mathematical and machine learning texts,

introducing the mathematical concepts with a minimum of prerequisites. It uses these concepts to derive four central machine learning methods: linear regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help build intuition and practical experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding. Programming tutorials are offered on the book's web site.

The Incarnation, traditionally understood as the metaphysical union between true divinity and true humanity in the one person of Jesus Christ, is one of the central doctrines for Christians over the centuries. Nevertheless, many scholars have objected that the Scriptural account of the Incarnation is incoherent. Being divine seems to entail being omniscient, omnipotent and omnipresent, but the New Testament portrays Jesus as having human properties such as being apparently limited in knowledge, power, and presence. It seems logically impossible that any single individual could possess such mutually exclusive sets

of properties, and this leads to scepticism concerning the occurrence of the Incarnation in history. A Kryptic Model of the Incarnation aims to provide a critical reflection of various attempts to answer these challenges and to offer a compelling response integrating aspects from analytic philosophy of religion, systematic theology, and historical-critical studies. Loke develops a new Kryptic model of the Incarnation, drawing from the Greek word Kryptsis meaning 'hiding', and proposing that in a certain sense Christ's supernatural properties were concealed during the Incarnation.

J. Kameron Carter argues that black theology's

intellectual impoverishment in the Church and the academy is the result of its theologically shaky presuppositions, which are based largely on liberal Protestant convictions, and he critiques the work of such noted scholars as Albert Raboteau, Charles Long and James Cone.

This volume presents two Leibnizian writings, the Specimen of Philosophical Questions Collected from the Law and the Dissertation on Perplexing Cases. These works, originally published in 1664 and 1666, constitute, respectively, Leibniz ' s thesis for the title of Master of Philosophy and his doctoral dissertation in law. Besides providing evidence of the earliest

development of Leibniz ' s thought and amazing anticipations of his mature views, they present a genuine intellectual interest, for the freshness and originality of Leibniz ' s reflections on a striking variety of logico-philosophical puzzles drawn from the law. The Specimen addresses puzzling issues resulting from apparent conflicts between law and philosophy (the latter broadly understood as comprising also mathematics, as well as empirical sciences). The Dissertation addresses cases whose solution is puzzling because of the convoluted logical form of legal dispositions and contractual clauses, or because of conflicting priorities between concurring parties. In each case, Leibniz dissects the problems with the

greatest ingenuity, disentangling their different aspects, and proposing solutions always reasonable and sometimes surprising. And he does not refrain from peppering his intellectual acrobatics with some humorous comments.
