Cell Structure and Function by Microspectrofluorometry provides an overview of the state of knowledge in the study of cellular structure and function using microspectrofluorometry. The book is organized into six parts. Part I begins by tracing the origins of modern fluorescence microscopy and fluorescent probes. Part II discusses methods such as microspectroscopy and flow cytometry; the fluorescence spectroscopy of solutions; and the quantitative implementation of fluorescence resonance energy transfer (FRET) in the light microscope. Part III presents studies on metabolism, including the mechanism of action of xenobiotics; biochemical analysis of unpigmented single cells; and cell-to-cell communication in the endocrine and the exocrine pancreas. Part IV focuses on applications of fluorescent probes. Part V deals with cytometry and cell sorting. It includes studies on principles and characteristics of flow cytometry as a method for studying receptor-mediated endocytosis; and flow cytometric measurements of physiologic cell responses. Part VI on bioluminescence discusses approaches to measuring chemiluminescence or bioluminescence in a single cell and measuring light emitted by living cells.

Originally published in German and French, the work is considered to be unsurpassed in both its scientific eloquence and accurate photographic documentation. Revising Brodmann's cortical parcellation system, von Economo took cytoarchitectonics to a new zenith.>The revised edition contains newly compiled tables with extensive quantitative data on the 107 cytoarchitectonic areas of Economo and Koskinas, plus all the 'transition' areas and full reproductions of the original microphotographs. It also contains the concluding chapter that appeared only in the 1929 English edition, with Economo's later views on cytoarchitectonic neuropathology and evolutionary neuroscience, enriched with material and figures from his later studies. Last but not least a newly discovered manuscript by Georg N. Koskinas, appears in English for the first time. In it, Economo's collaborator presents an insightful analysis of the 'General Part' of their larger textbook of cytoarchitectonics.

Book on cellular automata (CA) considers such questions as nonconstructible configurations, extremal possibilities of CA, complexity of finite configurations and global transition functions, modeling in CA, decomposition of global transition functions, appendices of CA, etc.

Describes the structural and functional features of the various types of cell from which the human body is formed, focusing on normal cellular structure and function and giving students and trainees a firm grounding in the appearance and behavior of healthy cells and tissues on which can be built a robust understanding of cellular pathology.
