dispersion of water droplets in oil. Emulsions can be difficult to treat and may cause several operational problems in wet-crude handling facilities and gas/oil separating plants. Emulsions can create high-pressure drops in flow lines, lead to an increase in demulsifier use, and sometimes cause trips or upsets ...

The gravity separation section removes flash gas and gas liberated as a result of heating the emulsion. The emulsion flows down the down-comer to a spreader, which is positioned below the oil – water interface. Exiting at the bottom of the down-comer, the emulsion rises to the top of the surrounding layer of

The use of homogenizers and other equipment to minimize droplet size will improve the stability of an emulsion. When naming the emulsion type, the first letter is the discontinuous phase. O/W stands for oil-in-water and is classified as an emulsion. W/O stands for water-in-oil and is classified as an invert emulsion.
