### Geometrical Properties of Vectors and Covectors

We are going to discuss two fundamental geometric properties of vectors in : length and direction. First, if  $\mathbf{v}$  is a vector with point, the of vector is defined to be the distance from the origin to, that is the length of the arrow representing. The following properties

these both have a very direct geometric interpretation. We draw a vector as a line with an arrow, for now I will call the end without the arrow the 'start' of the vector and the end with the arrow the 'end' of the vector.

The dot product of two unit vectors behaves just oppositely: it is zero when the unit vectors are perpendicular and 1 if the unit vectors are parallel. Unit vectors enable two convenient identities: the dot product of two unit vectors yields the cosine (which may be positive or negative) of the angle between the two unit vectors.
