A Blacksmith needs a forge for one simple reason. Burning fire or coal doesn't get hot enough to heat steel to the point where it can be worked. Yup! That is pretty much it. Wood will begin to burn at around 500 degrees fahrenheit and under normal conditions can get up to around 900 or 1000 degrees fahrenheit.

What is a blacksmith forge?

Best Fuel for a Blacksmith Forge | MOTHER EARTH NEWS

Iron must be very hot to shape with a hammer. Hot iron becomes cold very soon. A blacksmith has only a few seconds to hammer a piece of iron, before it must be put back in the fire to become hot again. A forge is a special oven for metalworking. It burns coal or charcoal in a very hot fire. A bellows pushes air into the forge, to make the fire burn hotter. The blacksmith puts pieces of iron in the fire to make them hot and to keep them hot until they use it.

Blacksmith - Simple English Wikipedia, the free encyclopedia

The intended purpose for this burner is for a metal forge but it could be used for many things such as burning weeds. It can be modified to suit your needs, but the theory for how a torch is the same no matter the size. Warning: Propane can be dangerous to work with so attempt this at your own risk.

The Hot Forging Manufacturing Process. The hot forging manufacturing process is performed at extreme high temperature (up to 1150 °C for steel, 360 to 520 °C for al-alloys, 700 to 800 °C for cu-alloys). This temperature is necessary in order to avoid strain hardening of the metal during deformation.

Cold Forging vs. Hot Forging - Farinia Group | Forge ...

The hot forging manufacturing process is performed at the highest temperature which does not destroy the metallurgical features of the considered alloy (up to 1250 °C for steel, 300 to 460 °C for Al-Alloys, 750 to 1040 °C for titanium alloys and 700 to 800 °C for Cu-Alloys). Recrystallization occurs simultaneously with deformation, thus avoiding strain hardening.
