Bayesian hierarchical modeling can  
produce robust models with naturally  
clustered data. They often allow us to  
build simple and interpretable models as  
opposed to the frequentist techniques like  
ensembling or neural networks that are  
commonly used for such complex data.

While previous research has suggested that empirical priors estimated from a separate dataset improve identifiability and predictive accuracy, this paper outlines an alternate method for the derivation of empirical priors: hierarchical Bayesian modeling. We provide a detailed introduction to this method, and show that using hierarchical models to simultaneously extract and impose empirical priors leads to better out-of-sample prediction while being more data efficient.

A hierarchical model provides a compromise between the combined and separate modeling approaches. In Section 10.2, a hierarchical Normal density was used to model mean rating scores from different movies. A great book I've found is "Introduction to Hierarchical Bayesian Modeling for Ecological Data" by Parent and Rivot 1. While at the FDA I code my own model without using any MCMC framework and it was very slow in R. I realize I need a MCMC framework under my toolbelt. After some research I decided on Stan using the rstan r package.
