Fractional calculus is allowing integrals and derivatives of any positive order (the term fractional is kept only for historical reasons) [5] [6] [7]. It can be considered a branch of mathematical physics that deals with integral-differential equations, where integrals are of convolution type and exhibit mainly singular kernels of power law or logarithm type.

Description. Fractional calculus (FC) is an emerging field of mathematics in an applications points of view, and it is applicable for almost all branches of applied sciences. It deals with the investigation and application of integrals and derivatives of arbitrary order. The combination of generalized FC and special functions are used to obtain potential results in the field of applied mathematics.

Fractional calculus extends the order of integer order calculus from integer to non-integer. Fractional order models based on fractional calculus can describe nature characteristics and property behavior of real-time systems more accurately. At present, fractional calculus has been widely used in various fields [2, 3, 4, 5, 6, 7]. It can be used to represent dynamic course of the system which cannot be described accurately by integer order system.

Fractional calculus is a branch of mathematical analysis that studies the several different possibilities of defining real number powers or complex number powers of the differentiation operator D = (),and of the integration operator J = ∫ (),and developing a calculus for such operators generalizing the classical one.. In this context, the term powers refers to iterative application of a ...
