I've begun running some Linux 4.14-rc1 kernel benchmarks and in some areas there appears to be nice gains with this in-development kernel. If you are behind on your Phoronix reading and don't know about all of the changes coming for this next kernel release -- which will also be an LTS kernel -- see our Linux 4.14 feature overview that was published this past weekend.

CPU Performance Scaling in Linux¶. The Linux kernel supports CPU performance scaling by means of the CPUFreq (CPU Frequency scaling) subsystem that consists of three layers of code: the core, scaling governors and scaling drivers.. The CPUFreq core provides the common code infrastructure and user space interfaces for all platforms that support CPU performance scaling.

Linux 4.14 has been released on 12 Nov 2017. Summary:

This release includes support for bigger memory limits in x86 hardware (128PiB of virtual address space, 4PiB of physical address space); support for AMD Secure Memory

Encryption; a new unwinder that provides better kernel traces and a smaller kernel size; a cgroups "thread mode" that allows resource distribution across the threads of a group of processes; support for the zstd compression algorithm has been added to Btrfs and Squashfs;
