The main goal of automating metrology into manufacturing processes is to ensure that the quality of products being built remains within the design tolerances by monitoring the process in real-time, allowing the warning or control limit settings to make adjustments to the process so that out-of-tolerance limits are never reached when tool wear occurs. This remedies any errors or deviations much faster, reducing the risk of making bad parts before any subsequent ones are manufactured.

Metrology is the scientific study of measurement. It establishes a common understanding of units, crucial in linking human activities. Modern metrology has its roots in the French Revolution's political motivation to standardise units in France, when a length standard taken from a natural source was proposed. This led to the creation of the decimal-based metric system in 1795, establishing a ...
