This chapter will focus on 1- Dimensional motion, so an appropriate reference frame will be the x axis (or y axis if the object is moving up and down). Since we need to know its position at all times, we can either use a table, listing its position, or a graph. It is easier to visualize the actual motion using a graph - a Position - Time graph.

Kinematics in One Dimension Kinematics analyzes the positions and motions of objects as a function of time, without regard to the causes of motion. It involves the relationships between the quantities displacement ( $d$ ), velocity ( $v$ ), acceleration ( $a$ ), and time ( $t$ ). The first three of these quantities are vectors.

A captivating presentation sure to get your students engaged! This city themed presentation is designed for algebra based physics classes to learn the concepts of one dimensional motion. This builds up the concepts of kinematics in a logical progression. We start with the understanding of what one dimensional motion is. Then we move to velocity, acceleration, motion graphs and free fall.

two closely related words. You might think  
that they are the same thing, but in physics  
we find that they are very different. Speed is a  
measure of how fast something moves.
