This relationship is called the work energy theorem: $W_{\text{net}} = K.E. f - K.E. o$, where $K.E. f$ is the final kinetic energy and $K.E. o$ is the original kinetic energy. Potential energy, also referred to as stored energy, is the ability of a system to do work due to its position or internal structure. Examples are energy stored in a pile driver at the top of its path or energy stored in a coiled spring.

The joule: defined as the energy needed to push with the force of one newton over the distance of one meter. Equivalent to one newton-meter (N·m) or one watt-second (W·s). $1 \text{ joule} = 1 \text{ J} = 1 \text{ newton} \cdot 1 \text{ meter} = 1 \text{ watt} \cdot 1 \text{ second}$. Energy comes in many varieties, including Kinetic energy, Potential energy, and Heat energy.
