Post-tensioning is now used extensively in bridges, elevated slabs (parking structures and residential or commercial buildings), residential foundations, walls, and columns. Copyright © 2006 by Evaluation and Certification Services, LLC. Unbonded monostrand tendons have been used since the 1960’s to reinforce the foundations of single and multi family homes, and are now used to reinforce hundreds of thousands of residential foundations throughout the United States each year.

principles may be applied to post-tensioned steel structures. Post-tensioning of cables and cable net structures that are integrated into the structural form generates a preload condition that controls deflection. The post-tensioned structural system uses unbonded steel tendons in ducts in large timber box beams. In moment-resisting timber frames, the horizontal steel tendons also pass through the columns, providing moment resistance. Added advantages for extreme loading are ductility, and total re-centring of the building after an earthquake.

A residential post-tensioned concrete slab will typically be 8 inches thick and use 3000 psi concrete. Once the concrete has gained strength to 2000 psi, typically within the 3 to 10 days recommended by PTI, the tendons are stressed. Tendons today are seven high-strength steel wires wound together and placed inside a plastic duct.

Use of post-tensioning in buildings achieves substantial benefits for all parties. Owners benefit from savings in materials in the structures and their foundations, reduced financing costs due to shorter construction periods, less maintenance, more usable space for a given building height and reduced structural deflection.

~~BUILDINGS - Post-tensioning | Structural engineering~~
Post-tensioned concrete is a term heard more and more in the construction industry today. This method of reinforcing concrete enables a designer to take advantage of the considerable benefits provided by prestressed concrete while retaining the flexibility afforded by the cast-in-place method of building concrete structures.

~~Post-Tensioned Slabs| Concrete Construction Magazine~~
Post-tensioned (PT) slabs are typically flat slabs, band beam and slabs or ribbed slabs. PT slabs offer the thinnest slab type, as concrete is worked to its strengths, mostly being kept in compression. Longer spans can be achieved due to prestress, which can also be used to counteract deflections.
