Free flap reconstruction also involves the transfer of living tissue from one part of the body to another, along with the blood vessel that keeps it alive. A free flap is a further modification of flap transfer where the flap is entirely disconnected from its original blood supply and then reconnected using microsurgery in the recipient site.

Reconstructive Surgery | BAPRAS

Using tissue from another part of the body An operation that moves tissue from one part of the body to another is called a reconstruction free flap or flap repair. Your surgeon might take tissue from an area such as the bowel or the muscles in the arms, back or tummy, and use this to replace sections of the mouth or throat.

Reconstructive surgery | Mouth cancer | Cancer Research UK

Your primary surgeon will remove the tumor,

Acces PDF Reconstructive Surgery Soft Tissue Free Flaps

bone, and soft tissue. Your reconstructive surgeon will take a free flap (block of skin, tissue, muscle, or bone) from the donor site and attach it to the recipient site. They will use a microscope to see and connect the tiny blood vessels in the free flap with the blood vessels at the recipient site.

Reconstructive Surgery - an overview / ScienceDirect Topics

Reconstruction of the floor of the orbit may be accomplished with use of a free osteocutaneous flap or by combining a bone graft with a soft tissue free flap, depending on the circumstances. If alloplastic material such as titanium mesh is used to repair the floor of the orbit, then adequate soft tissue coverage should be provided to avoid exposure and extrusion of the alloplastic material.

Free tissue transfer has become commonplace in many centers around the world. The numerous advantages of this technique include stable wound coverage, improved aesthetic and functional outcomes, minimal donor site morbidity, and the ability to utilize vascularized tissue from remote parts of the body that are outside the zone of injury (trauma, malignancy, infection, irradiation, etc).
