Definition: A group is a set with a binary operation that is associative, contains an identity element and inverse elements for that operation. If multiplication is commutative, then we say the group is an Abelian Group. We note that groups only have one binary operation while fields and rings have two binary operations. Example 7

4 Groups,RingsandFields 1. Binary operations, and a first look at groups 1.1 Binary operations. Let  $S$  be a non-empty set. A map  $(bop) \star: S \times S \rightarrow S, (a,b) \mapsto a \star b$  is called a binary operation on  $S$ . So  $\star$  takes 2 inputs  $a,b$  from  $S$  and produces a single output  $a \star b \in S$ . In this situation we may say that ' $S$  is closed under  $\star$ '.

A field is a ring in which the elements, other than the identity element for addition, and the multiplication operator, also form a group. There are only two kinds of finite fields. One kind is the field formed by addition and multiplication modulo a prime number.

Now for any  $a \in G$  we have  $ea = (ay(a))a = a(y(a)a) = ae = aa$  so  $e$  is a right identity. Hence  $e$  is a left identity. 2.4. If  $G$  is a group of even order, prove that it has an element  $a \in G$  satisfying  $a^2 = e$ :

A group ring is also referred to as a group algebra, for it is indeed an algebra over the given ring. A group algebra over a field has a further structure of a Hopf algebra; in this case, it is thus called a group Hopf algebra. The apparatus of group rings is especially useful in the theory of group representations

In mathematics, a field is a set on which addition, subtraction, multiplication, and division are defined and behave as the corresponding operations on rational and real numbers do. A field is thus a fundamental algebraic structure which is widely used in algebra, number theory, and many other areas of mathematics.. The best known fields are the field of rational numbers, the field of real ...

Groups, rings, and fields are the fundamental elements of a branch of mathematics known as abstract algebra, or modern algebra. In abstract algebra, we are concerned with sets on whose elements we can operate algebraically; that is, we can combine two elements of the set, perhaps in several ways, to obtain a third element of the set.
