Few pieces of furniture, save perhaps chairs, work as hard as doors. Building them to last, especially exterior doors, takes knowledge and experience that don't come from making other types of furniture, such as tables and bookcases. Doormaking: Materials, Techniques and Projects for Building Your First Door by woodworker Strother Purdy gathers all the information and guidance that both beginning and intermediate woodworkers need to be successful making their first door. While covering the construction of the eight most popular doors, Doormaking: Materials, Techniques and Projects for Building Your First Door starts first by addressing the fundamentals: the basics of good design and proper construction technique, the pros-and-cons of common materials including wood and sheet goods, interior and exterior finishes, hardware and the fine points of hanging doors. Once those key elements are covered, Doormaking: Materials, Techniques and Projects for Building Your First Door offers project chapters that walk the reader step-by-step through the construction of eight essential doors, explaining design and material choices in specific contexts, tool options and other considerations. The first four projects are easily accessible to a beginner while the remaining projects offer up some more challenging details for the intermediate woodworker. Also included are sidebars containing amusing anecdotes and mistake stories - each delivering tips as well as details for hanging a door - and an inspiring gallery of doors that are sure to inspire. Doormaking: Materials, Techniques and Projects for Building Your First Door is a must for any woodworking hobbyist, professional craftsman, or DIY homeowner.

Energetic ion beam irradiation is the basis of a wide plethora of powerful research- and fabrication-techniques for materials characterisation and processing on a nanometre scale. Materials with tailored optical, magnetic and electrical properties can be fabricated by synthesis of nanocrystals by ion implantation, focused ion beams can be used to machine away and deposit material on a scale of nanometres and the scattering of energetic ions is a unique and quantitative tool for process development in high speed electronics and 3-D nanostructures with extreme aspect ratios for tissue engineering and nano-fluidics lab-on-a-chip may be machined using proton beams. This book will benefit practitioners, researchers and graduate students working in the field of ion beams and application and more generally everyone concerned with the broad field of nanoscience and technology.

Integrated Silicon Optoelectronics synthesizes topics from optoelectronics and microelectronics. The book concentrates on silicon as the major base of modern semiconductor devices and circuits. Starting from the basics of optical emission and absorption, as well as from the device physics of photodetectors, the aspects of the integration of photodetectors in modern bipolar, CMOS, and BiCMOS technologies are discussed. Detailed descriptions of fabrication technologies and applications of optoelectronic integrated circuits are included. The book, furthermore, contains a review of the newest state of research on eagerly anticipated silicon light emitters. In order to cover the topics comprehensively, also included are integrated waveguides, gratings, and optoelectronic power devices. Numerous elaborate illustrations facilitate and enhance comprehension. This extended edition will be of value to engineers, physicists, and scientists in industry and at universities. The book is also recommended to graduate students specializing on microelectronics or optoelectronics.
