To achieve the objectives of the current design, steel-concrete composite bridges (SCCBs) can be a good alternative due to the recyclability of the steel parts of the structure . SCCBs have been used extensively since the 20 th century, when composite structure theories were developed more generally . In addition, Musa and Diaz state that this type of bridge is highly efficient due to the possibility of placing the steel and concrete in the parts of the cross section where they perform best.

summary. 1. In Steel building design: Medium rise braced frames (P365)[1], general guidance is given on a range of floor systems suitable for steel framed buildings. Many of those systems involve use of a composite floor slab – concrete acting compositely with profiled steel sheeting – and most use steel beams acting compositely with the floor slab.

Composite steel beams replace the joists at the spandrel locations to help control cladding deflections. The lateral load-resisting system is a C-PRMF in accordance with Standard Table 12.2-1 and AISC 341 Part II Section 8. The C-PRMF uses PRCCs at almost all beam-to-column connections. A conceptual detail of a PRCC is presented in Figure 9.1-4.
